

Fanlit

Compressed-NFT ticketing with built-in anti-scalping resale and fan rewards

The Problem & Our Solution

Fans face scalped tickets and fakes; organizers and artists see none of the resale value. Fanlit fixes this with compressed NFT tickets on Solana.

- Scalpers resell tickets far above face value, hurting fans and blocking real buyers.
- Counterfeit tickets are common and hard to verify at the door.
- Organizers and artists get zero share of resale profits today.
- Fanlit uses Solana compressed NFTs for cheap, verifiable tickets with enforced resale caps.
- Royalties from resale automatically split to organizers and artists.

How It Works

From purchase to check-in to rewards, every step is verifiable on-chain using low-cost compressed NFTs.

- Fans buy a compressed NFT ticket minted via Metaplex Bubblegum at near-zero cost.
- Resale marketplace enforces a max price cap and splits royalties to organizer and artist.
- QR check-in app verifies NFT ownership on-chain before entry, blocking duplicates.
- After check-in, fans receive a loyalty NFT badge unlocking perks at future shows.
- Organizer dashboard tracks ticket sales, resale activity, and royalty payouts in real time.

Built with

Solana, Metaplex Bubblegum (cNFTs),
Anchor, React, Phantom Wallet Adapter,
QR scanning library, Helius RPC

Why Now & What's Next

Compressed NFTs just made mass ticket issuance affordable, and anti-scalping demand is at an all-time high.

- cNFTs cut minting costs enough to issue thousands of tickets per event affordably.
- Rising global live event prices are fueling demand for fair, transparent ticketing.
- Next: pilot with a local indie music venue or event series.
- Then: add secondary market integrations and polish mobile wallet UX.
- Later: expand loyalty program into a cross-event fan rewards network.
